

Charging Energy Storage Solutions

How do battery energy storage systems help EV charging? Battery energy storage systems can enable EV fast charging build-out in areas with limited power grid capacity, reduce charging and utility costs through peak shaving, and boost energy storage capacity to allow for EV charging in the event of a power grid disruption or outage. Why is energy storage important for EV charging infrastructure? Incorporating energy storage into EV charging infrastructure ensures a resilient power supply, even during grid fluctuations or outages. This reliability is crucial for businesses that rely on EV fleets for daily operations, as well as municipalities working toward sustainable public transportation solutions. How does battery energy storage work? When an EV requests power from a battery-buffered direct current fast charging (DCFC) station, the battery energy storage system can discharge stored energy rapidly, providing EV charging at a rate far greater than the rate at which it draws energy from the power grid. Why Consider Battery Energy Storage? Can battery-buffered charging systems reduce power grid service needs? An analysis by the National Renewable Energy Laboratory (NREL) shows that appropriately sized battery-buffered systems can reduce power grid service capacity needs by approximately 50% to 80% compared to a charging station that is powered entirely by the power grid, while offering an identical charging experience for motorists.¹ Why should your business use a battery energy storage system? Provide your customers with the green amenities they need and future-proof your business all while generating savings on your utility bill. Utilize our battery energy storage system for high power output applications, improved resilience, and energy arbitrage. Supercharge your electric fleet with our industrial charging applications. How do charging stations reduce energy supply & demand? Balancing energy supply and demand. Reduce grid fees with peak shaving. Charging stations have an intermittent energy load profile. In many countries grid operators apply demand charges to commercial and industrial electricity. \$3 Million Awarded To Integrate Electric Vehicles Into The Grid.
