What is the inner goal of a 5G base station? The inner goal included the sleep mechanism of the base station, and the optimization of the energy storage charging and discharging strategy, for minimizing the daily electricity expenditure of the 5G base station system. What is the sleep mechanism of a base station? The sleep mechanism of a base station refers to the intelligent shutdown of major power consumption devices, such as the AAU of the base station, when there is no load or the load is low, such that the energy consumption is greatly reduced. Does a 5G base station use energy storage power supply? In this article, we assumed that the 5G base station adopted the mode of combining grid power supply with energy storage power supply. What factors affect communication coverage of a base station? The communication coverage of a base station is closely related to transmitting power, frequency, and other factors. When the frequency of a base station increases and the transmitting power decreases, its coverage decreases. Why does a base station have a low power load? Therefore, when the electricity price was at its peak, the base station system had a low power load and would discharge to the grid in part of the time. Conversely, when the electricity price was at its low, the base station system had a high power load. What is the traditional configuration method of a base station battery? The traditional configuration method of a base station battery comprehensively considers the importance of the 5G base station, reliability of mains, geographical location, long-term development, battery life, and other factors.
