

## There is a green communication base station next to the residents

Where should cell base stations be located? An analysis of 100 studies published in Environmental Reviews found approximately 80% showed biological effects near towers. "As a general guideline, cell base stations should not be located less than 100 ft from the population, and at a height of about 150 ft" (Levitt ). How high should a cell phone base station be? Cell phone base stations can be free-standing towers or mounted on existing structures, such as trees, water tanks, or tall buildings. The antennas need to be high enough to adequately cover a certain area. Base stations are usually from 50 to 200 feet high. Are 4G & 5G towers regulated by the FCC? Cellular providers aren't legally required to disclose the locations of the 4G and 5G towers and most prefer to keep that information private for security reasons. Additionally, the Federal Communications Commission (FCC) only requires carriers to register cell towers that are over 200 feet tall, and many are much smaller. Do mobile towers emit RFR? Mobile towers emit RFR as part of their communication process, transmitting signals to and from mobile devices within their coverage area. While these signals enable seamless wireless communication, there is ongoing debate and research concerning the safety of prolonged exposure to RFR emitted by mobile towers. Where do cell phone base station antennas get the highest RF levels? Academy of Sciences Journal found the highest RF levels in areas where the cell phone base station antennas were placed on top of utility poles, street lamps, traffic lights or other posts near to the street. What is the energy level behind a base station? The level of energy from RF waves inside buildings where a base station is mounted is typically much lower than the level outside, depending on the construction materials of the building. Antennas are pointed away from the side of the building, and the energy level behind the antenna is hundreds to thousands of times lower than in front. A year of operation of a powerful base transmitting station for mobile communication reportedly resulted in a dramatic increase of cancer incidence among the population living nearby (Yakymenko ). A year of operation of a powerful base transmitting station for mobile communication reportedly resulted in a dramatic increase of cancer incidence among the population living nearby (Yakymenko ). Every municipality is responsible for adopting its own set of laws governing the placement, design standards, and safety features of wireless telecommunications equipment installed and/or operated by companies like Verizon, AT&T, T-Mobile, Dish, and Crown Castle. Strong local cell tower laws are Cell phone base stations can be free-standing towers or mounted on existing structures, such as trees, water tanks, or tall buildings. The antennas need to be high enough to adequately cover a certain area. Base stations are usually from 50 to 200 feet high. Cell phones communicate with nearby cell EHT Executive Director Theodora Scarato was invited along with lawyer Andrew Campanelli to present to the development Board of Pittsfield Massachusetts to speak on cell tower setbacks and what cities can do to ensure they retain their authority regarding placement of cell antennas in neighborhoods. If you have underground phone wiring in your neighborhood, as opposed to phone wiring that runs in the air on poles, then you will frequently see these little boxes all over your neighborhood -- one for every two or three houses or so. A typical box in the southeastern United States might look like Spain's Teltronic has introduced its new GBS (Green
